

# **Targeted Application to Reduce Pesticide Rates**

**Ken Giles  
David Slaughter**

**Biological & Agricultural Engineering Department  
University of California, Davis USA**

**California Department of Pesticide Regulation  
VOC Symposium**

**Sacramento, CA  
23 May 2007**

**Off-site protection**

**Efficacy**

**Productivity**

Three critical  
aspects of  
ag spraying

Successful changes  
in practices address  
all three

# Agrochemical application in California

**Proximity to sensitive areas, either natural or man-made is common.**

# Tools to reduce application rates:

## ⇒ Improved nozzles

- \* Droplet size management
- \* Better targeting

## ⇒ Adjuvants

- \* Reduce liquid rates
- \* Achieve small droplet quality deposition and efficacy with larger droplets

## ⇒ Targeted application

- \* Sensors and controllers
- \* Reduce non-target deposition

# Nozzle Technology

- Trend toward larger droplets
- Using air induction
- Manipulating droplet velocities

# Air induction nozzle

- A passive air flow
- Reduces small droplets
- Can create bubbles in droplets

# Air induction nozzle

## water

**Standard  
Nozzle**

**A.I  
Nozzle**

# Air induction nozzle

water + 0.5% surfactant

**Standard  
Nozzle**

**A.I  
Nozzle**

# Droplet deposition

Bergeron, 2003

Water

0.508 mm orifice

5 cm distance

70 kPa

100 ms pulse

Poor spread

Water + surfactant

0.508 mm orifice

5 cm distance

70 kPa

100 ms pulse

Splash

Water + surfactant  
+ polymer

0.508 mm orifice

5 cm distance

70 kPa

100 ms pulse

Good spread

Splash inhibited

**Water without an adjuvant**

# Effect of adjuvant on deposition

Silicone surfactant  
50 gallons / acre

No spray

No adjuvant  
100 gal / acre

Grower standard  
Air blast with  
Disc-core at 200 gals/acre  
With conventional spreader

Air blast  
sprayer  
AI nozzles  
@ 160 gals/ac  
W/ alternate  
adjuvant

Multi-fan w/  
AI nozzle  
@ 40 gals/ac  
w/ silicone

**Miller *et al.* (2003) concluded:  
“Most of the spray movement out of the  
tree canopy was in the spaces between  
trees...”**

“One way to reduce drift  
may be to turn off the spray  
between tree crowns...”

# Spray deposit partitioning in orchards

<u>Author</u>	<u>Condition</u>	<u>Ground</u>	<u>Target</u>	<u>Drift</u>
Seiber	Dormant	25 – 45%	-	-
Cross	Both	43 - 63%	-	16%
Vercruysse	Both	-	56 – 68%	-
Pergher	In season	-	37 – 62%	-
Fox	“Sparse”	57%	-	-
Miller	In season	22%	57%	4.6 (16%)

# Ultrasonic measurement of trees for control of spray sections.

**Savings depends on orchard age, size, gaps, etc.**

**Some trials have shown 50 - 70 % savings.**

# Field test – dormant plums Chico

Air-O-Fan 2D40 engine-driven sprayer  
“Smart Spray” ultrasonic control system (retrofit)

# Field test – dormant walnuts Davis

Durand-Wayland AF500CPS PTO-driven sprayer

Nozzle configuration was “center-weighted” spray

# Field test – sampling

# Field test – dormant almonds

## Ceres

Durand-Wayland AF500 Smart Sprayer

Nozzle configuration was  
“center-weighted” spray

0.5 kg/ha Lorsban (chlorpyrifos)

# Deposition sampling - almonds

# Performance results

3 crops, 3 chemicals, 3 sprayers,  
3 locations, 3 operators ...

Use of system had no significant effect on target deposition

- Plum orchard –
  - 15% reduction in a.i. rate
  - 5% less ground deposit
- Walnut orchard –
  - 45% reduction in a.i. rate
  - 58% less ground deposit
- Almond orchard -
  - 22% reduction in a.i. rate
  - 71% less ground deposit

**Based on these results, a run-off  
experiment was conducted in a 40 acre  
prune orchard in Biggs.**

# Field test – Prunes Biggs

Durand-Wayland AF500 Smart Sprayer

Measurements:

Spray savings  
Ground deposit  
Runoff

## Results from “Smart” Spraying

**Spray Savings: 39%**

**Ground Deposit: - 54%**

**Diazinon in Runoff: - 44%**

# A typical target scene within the row

# A typical target scene within the row

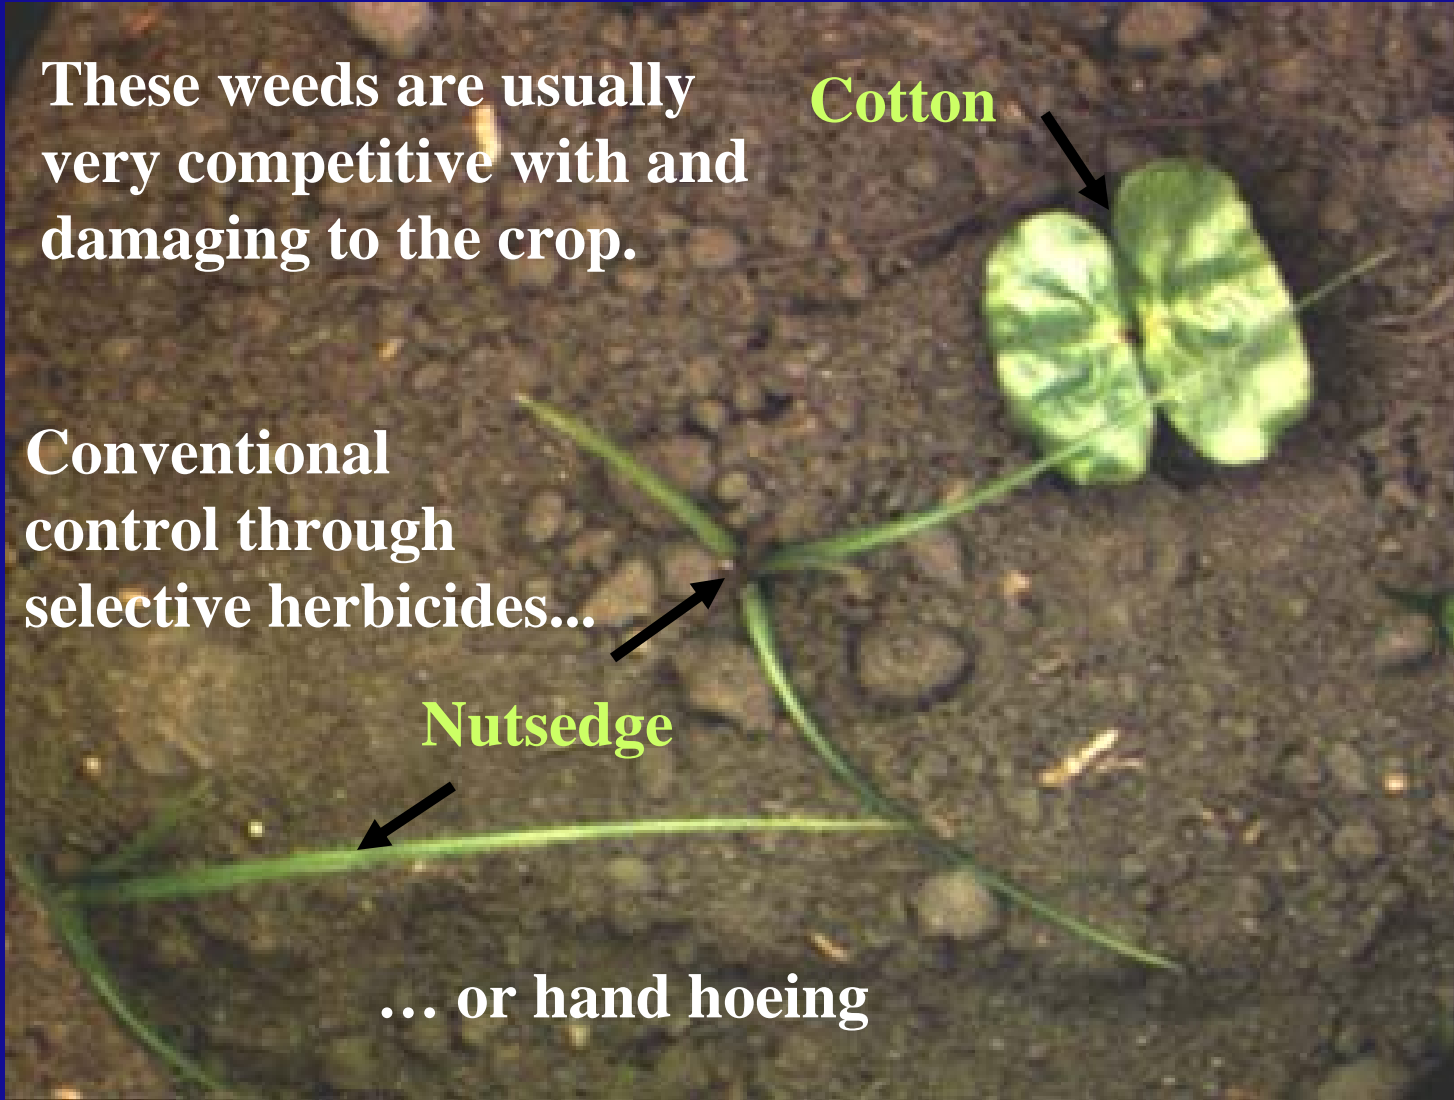

These weeds are usually  
very competitive with and  
damaging to the crop.

Cotton

Conventional  
control through  
selective herbicides...

Nutsedge

... or hand hoeing

# Process for image analysis

# Generating a precise spray micro-map (10 cm x 15 cm)

Replacing chemical selectivity  
with spatial selectivity

The concept..

“Leaf-specific”  
agriculture

# Process for spatially selective application of non-selective herbicide
